Assignment 0206 Feedback

Proficiencies for *1a* and *1b* still only go as high as | in this assignment due to our still being in the early going with respect to these outcomes. The next assignments with these proficiencies will be expansive enough to merit a + maximum.

Stephen S. Smith

stephenscottsmith / crashprophet@gmail.com

1a — You had a couple of hiccups, but other than those you did a great job with figuring out and issuing process/memory/file commands. (|)

1b — Looks safe to say that you can redirect I/O at will. (|)

1c — You connected to and worked with *my.cs.lmu.edu* and *screen*, respectively. No problem with tunneling either. Hacker! :) (+)

3a — Good forensics work there! The only evidence that was off was the one pertaining to pre-OS software. I preferred that you ran it; besides, the files that you showed were already on the disk volume, so those might not be the *actual* files in use when you are in pre-OS state. But that was it, so in the end I don't think it's enough to drag down your proficiency. (+)

4d — You did a decent job all around in terms of locating the necessary information, from finding the right command options to your CSI work. There was that one case where you seem to have used the *man* page on a Mac but tried the command on Linux, but again not enough to drag the proficiency down. (+)

4e — Two commits for all that—really? I think you could have structured this better. `EliteStatus -= 0.5` (includes pity points for getting sick). (|)

4f — Submitted a few days late due to illness, so OK, fine, I'll be nice. (+)
